September 26, 2026

Greetings,

We are thrilled to announce a new release of the MOLE 1.3.0 library. The MOLE Library implements high-order mimetic operators in different programming languages. MOLE provides discrete analogs of the most common vector calculus operators: Divergence, Gradient, Curl, and Laplacian. These operators act on functions discretized over staggered grids (uniform, nonuniform, and curvilinear), and they satisfy local and global conservation laws. MOLE's operators can be used to develop computationally efficient programs for solving linear and nonlinear partial differential equations (PDEs) with higher orders of accuracy than other methods.

MOLE v1.3.0 has been implemented in four different programming languages; C++, Python, Julia and GNU Octave (100% compatible with MATLAB).

Visit the MOLE Open-source Software Ecosystem website for more news and MOLE related events at: mole-ose.org
